

**AMENDMENTS TO THE CLAIMS**

Please amend the claims as follows:

1. (Currently Amended) A loudspeaker system having a line array of drivers comprising:
  - a first pair of drivers configured to receive a signal from a sound source;
  - a center point along the line array, wherein the first pair of drivers are substantially centered about the center point with a center to center distance of  $d_0$  between the first pair of drivers, ~~and wherein the first pair of drivers receive a signal comprising a first frequency band;~~
  - at least a subsequent pair of drivers arranged in the line array with the first pair of drivers and substantially centered about the center point, wherein the subsequent pair of drivers are spaced such that the center to center distance between each at least a subsequent pair of drivers,  $d_n$ , is equal to  $4nd_0$ , where  $n = 0$  at the first pair of drivers and  $n$  increases by 1 for each at least a subsequent pair of drivers, ~~wherein a low pass filter is associated with each of the at least a subsequent pair of drivers, and wherein the corner frequency,  $f_n$ , of each such low pass filter is equal to  $2c/d_n$ , where  $c$  is the speed of sound, wherein the at least a subsequent pair of drivers receive a signal comprising a second frequency band; and~~
  - wherein the first frequency band and the second frequency band comprise a common frequency band at a common level of attenuation.
2. (Canceled)
3. (Canceled)
4. (Currently Amended) The loudspeaker system of claim 1 2, wherein each low pass filter is of first order.
5. (Canceled)
6. (Currently Amended) The loudspeaker system of claim 1 3, further comprising an outermost pair of drivers in the array, wherein the low pass filter on the outermost pair of drivers in the array has a corner frequency calculated by  $f_n = c/d_n$ .
7. (Original) The loudspeaker system of claim 1, further comprising a driver centered on the center point of the line array.

8. (Currently Amended) A transducer spacing arrangement in an array, the arrangement comprising:
- a first pair of transducers having a first distance,  $d_0$ , between the center points of the transducers in the first pair of transducers, wherein the transducers are configured to receive a signal from a sound source;
  - a second pair of transducers arranged in the array with the first pair of transducers and having a second distance,  $d_1$ , between the center points of the transducers in the second pair of transducers, wherein the midpoint of  $d_0$  is the same midpoint of  $d_1$ , and wherein the second distance,  $d_1$ , is equal to  $4d_0$ ;
  - a low pass filter of first order on the second pair of transducers, wherein the first pair of transducers receives a signal comprising a first frequency band and the second pair of transducers receives a signal comprising a second frequency band, and wherein the corner frequency,  $f_n$ , of each such low pass filter is equal to  $2c/d_n$ , where c is the speed of sound.; and  
wherein the first frequency band and the second frequency band comprise a common frequency band at a common level of attenuation.
9. (Canceled)
10. (Previously Presented) The transducer spacing arrangement of claim 8 , wherein  $d_0$  is 1.2 inches, and  $d_1$  is 4.8 inches.
11. (Original) The transducer spacing arrangement of claim 8, further comprising a transducer at the center point of  $d_0$ .
12. (Previously Presented) The transducer spacing arrangement of claim 8, further comprising at least a third pair of transducers, and a low pass filter of first order on the at least a third pair of transducers.
13. (Previously Presented) The transducer spacing arrangement of claim 12, wherein the outermost pair of transducers in the array has the lowest frequency low pass filter.
14. (Currently Amended) A method for optimizing a radiation pattern of drivers in a line on a loudspeaker, the method comprising ~~the steps of~~:

selecting a spacing,  $d_0$ , between the centers of a pair of innermost drivers according to the formula  $d_0 = c/2f$  wherein  $c$  is the speed of sound and  $f$  is the maximum desired operational frequency and wherein the pair of innermost drivers receive a signal comprising a frequency band  $z_0$ ;

selecting a center point in the line, wherein the center point is the same position on the line as  $d_0/2$ ; and

determining the spacing of at least one additional pairs of drivers in the line wherein each driver of the additional pair of drivers is added to the outermost positions of the line, wherein the distance,  $d_n$ , between the centers of the additional drivers is according to the formula  $d_n = 4nd_0$  where  $n = 0$  at the innermost pair of drivers and  $n$  increases by 1 with each pair of drivers sequentially added along the array, and wherein the at least one additional pair of drivers receive a signal comprising a frequency band  $z_n$ ;

wherein each of the frequency bands  $z_0$  through  $z_n$  comprise a common frequency band at a common level of attenuation, wherein the at least one additional pair of drivers are used in conjunction with low pass filtering, and wherein the corner frequency,  $f_n$ , of the low pass filters for each pair of drivers is calculated according to the equation  $f_n = 2c/d_n$ .

15. (Canceled)

16. (Currently Amended) The method of claim 14 15, wherein the low pass filtering is of the first order.

17. (Canceled)

18. (Currently Amended) The method of claim 14 15, further comprising selecting an outermost pair of drivers for the array, wherein the low pass filter for the outermost pair of drivers has a corner frequency calculated by the equation of  $f_n = c/d_n$ .

19. (Original) The method of claim 14, wherein the maximum desired operational frequency is substantially the highest frequency without high amplitude side lobes.
